

Wireframe 1 – Main Interface Layout

This wireframe presents the overall structure of the music player application. It contains the four main sections of the interface:

- Favorite Songs on the left side for saved favorite tracks
- Playlist in the center-left section showing the list of songs
- Now Playing Section in the center with the album artwork, song details, playback controls, progress bar, and volume slider
- Recently Played on the right side displaying recently played songs

Why this layout? How does it serve your user personas?

This layout was designed to give users quick access to their favorite songs, playlists, currently playing music, and recently played tracks in one screen. It supports users who prefer multitasking and fast navigation while listening to music.

What user need does this address?

This addresses the need for easy music navigation and quick access to frequently used features. One persona pain point was difficulty finding songs quickly, so the layout organizes the music library into clear sections for easier browsing.

What HCI principle guided this decision?

The design follows the HCI principles of:

- Visibility by displaying important controls and sections clearly
- Consistency through uniform layout and placement
- Efficiency by reducing the number of clicks needed to access songs and controls

Wireframe 2 – Now Playing Section

This wireframe focuses on the music player controls and current song display. It includes:

- Album artwork placeholder
- Song information area
- Progress/seek bar
- Playback controls such as play/pause, next, and previous buttons
- Volume slider

Why this layout? How does it serve your user personas?

This layout focuses on the currently playing song to help users easily control playback while listening to music. The controls are placed in the center for quick and comfortable interaction.

What user need does this address?

This addresses the user need for simple and accessible playback controls. One persona pain point was difficulty adjusting music controls while multitasking, so the layout keeps all important controls visible and easy to use.

What HCI principle guided this decision?

The design follows the HCI principles of:

- Feedback through visible playback status and progress bars
- Accessibility by using large and centered controls
- Visibility so users can immediately recognize available actions

Wireframe 3 – Interaction States

This wireframe shows the different interaction states within the application, such as:

- Highlighted or active song in the playlist
- Currently playing song indicator
- Selected item states
- Active playback state

Why this layout? How does it serve your user personas?

This layout demonstrates how the interface responds to user actions such as selecting songs, playing music, and marking favorites. It helps users understand the current state of the application.

What user need does this address?

This addresses the need for clear visual feedback during interaction. One persona pain point was confusion about which song was currently playing, so highlighted states and indicators were added for better user awareness.

What HCI principle guided this decision? The design follows the HCI principles of:

- Feedback by showing active and selected states
- Consistency through repeated interaction patterns
- Recognition rather than recall by visually identifying the current action and selected items
